Recommendation Letter

Aug 25, 2023

To Whom It May Concern,

Jayce Bordelon worked as a software engineer intern at Synopsys this summer. As his supervisor during his internship, I had the pleasure of witnessing his exceptional talents and proactive approach firsthand.

From the moment Jayce joined our team, it was evident that his enthusiasm set him apart from other Interns I had hired before. His first assignment was to work on several bugs and enhancements to a critical business web application used by 20K+ employees daily. He quickly grasped the requirements, learned about the architecture of the application, and was able to get a few bugs fixed just in few days after his onboarding. His aptitude for problem-solving, strong analytic skills, and swift actions to produce outcomes were truly impressive.

Compared with those bugs, the enhancement requests he worked on were much more complex, which required integration with Microsoft Graph API, restructuring database schemas, and extending backend API endpoints and routes. Jayce actively sought out inputs and comments from me and his teammates, had several iterations to improve his design proposals, and successfully delivered the results with all design requirements fulfilled.

In the last two weeks of his internship, Jayce worked on a task to build a prototype framework for a self-service web application used for container management on the Kubernetes cluster. Many of these technologies were new to him. But his eagerness to take on new challenges and willingness to go the extra mile had rendered these obstacles seemingly effortless to overcome.

Looking back to his two-month internship this summer, Jayce constantly exceeded expectations and demonstrated his dedication to continuous improvement. He collaborated seamlessly with his teammates, displaying strong communication skills and an ability to work effectively in a team environment. It was such a pleasure to work with Jayce and I certainly do not doubt that I'll hire him again next year if possible. I'm also confident that he will continue to excel no matter where he works and will soon grow into a brilliant software engineer.

Sincerely,

Jun Li
